

### Special characters

.	Default: Match any character except newline
.	DOTALL: Match any character including newline
^	Default: Match the start of a string
^	MULTILINE: Match immediately after each newline
\$	Match the end of a string
\$	MULTILINE: Also match before a newline
*	Match 0 or more repetitions of RE
+	Match 1 or more repetitions of RE
?	Match 0 or 1 repetitions of RE
*?, *, +, ??	Match non-greedy as <i>few</i> characters as possible
{m}	Match exactly <i>m</i> copies of the previous RE
{m,n}	Match from <i>m</i> to <i>n</i> repetitions of RE
{m,n}?	Match non-greedy
\	Escape special characters
[]	Match a <i>set</i> of characters
	<i>RE1 RE2</i> : Match either RE1 or RE2 non-greedy
(...)	Match RE inside parentheses and indicate start and end of a group

With RE is the resulting regular expression.

Special characters must be escaped with \ if it should match the character literally

### Methods of 're' module

<code>re.compile( pattern, flags=0)</code>	Compile a regular expression pattern into a regular expression object. Can be used with <i>match()</i> , <i>search()</i> and others
<code>re.search( pattern, string, flags=0)</code>	Search through <i>string</i> matching the first location of the RE. Returns a <b>match object</b> or <b>None</b>
<code>re.match( pattern, string, flags=0)</code>	If zero or more characters at the beginning of a string match <i>pattern</i> return a <b>match object</b> or <b>None</b>
<code>re.fullmatch( pattern, string, flags=0)</code>	If the whole <i>string</i> matches the <i>pattern</i> return a <b>match object</b> or <b>None</b>
<code>re.split( pattern, string, maxsplit=0, flags=0)</code>	Split <i>string</i> by the occurrences of <i>pattern</i> <i>maxsplit</i> times if non-zero. Returns a <b>list</b> of all groups.
<code>re.findall( pattern, string, flags=0)</code>	Return all non-overlapping matches of <i>pattern</i> in <i>string</i> as <b>list</b> of strings.
<code>re.finditer( pattern, string, flags=0)</code>	Return an <b>iterator</b> yielding <b>match objects</b> over all non-overlapping matches for the <i>pattern</i> in <i>string</i>

### Methods of 're' module (cont)

<code>re.sub( pattern, repl, string, count=0, flags=0)</code>	Return the <b>string</b> obtained by replacing the leftmost non-overlapping occurrences of <i>pattern</i> in <i>string</i> by the <i>replacement repl</i> . <i>repl</i> can be a function.
<code>re.subn( pattern, repl, string, count=0, flags=0)</code>	Like <b>sub</b> but return a tuple ( <i>new_string</i> , <i>number_of_subs_made</i> )
<code>re.escape( pattern)</code>	Escape special characters in <i>pattern</i>
<code>re.purge()</code>	Clear the regular expression cache

### Raw String Notation

In raw string notation `r"te xt"` there is no need for the backslash character again.

```
>>> re.match(r"\W(.)\1\W", "
<re.Match object; span=(0, 4), mat
>>> re.match(" \\W (.) \\1 \\W "
<re.Match object; span=(0, 4), mat
```

### Extensions

(?...)	This is the start of an extension
(? <i>aiLmsux</i> )	The letters set the corresponding flags <i>See flags</i>
(?:...)	A non-capturing version of regular parentheses

### Extensions (cont)

(?P<name>...)	Like regular paranthes but with a <i>named</i> group
(?P=name)	A backreference to a <i>named</i> group
(?#...)	A comment
(?=...)	<i>lookahead assertion</i> : Matches if ... matches next without consuming the string
(?!...)	<i>negative lookahead assertion</i> : Matches if ... doesn't match next
(?<=....)	<i>positive lookbehind assertion</i> : Match if the current position in the string is preceded by a match for ... that ends the current position
(?<!...)	<i>negative lookbehind assertion</i> : Match if the current position in the string is <b>not</b> preceded by a match for ...
(?(id/name)yes-pattern no-pattern)	Match with <i>yes-pattern</i> if the group with gived <i>id</i> or <i>name</i> exists and with <i>no-pattern</i> if not

### Match objects

Match.expand( <i>template</i> )	Return the string obtained by backslash substitution on <i>template</i> , as done by the <b>sub()</b> method
Match.group([ <i>group1</i> ,...])	Returns one or more subgroups of the match. 1 Argument returns <b>string</b> and more arguments return a <b>tuple</b> .
Match.__getitem__( <i>g</i> )	Access groups with m[0], m[1]...
Match.groups( <i>default=None</i> )	Return a <b>tuple</b> containing all the subgroups of the match
Match.groupdict( <i>default=None</i> )	Return a <b>dictionary</b> containing all the <i>named</i> subgroups of the match, keyed by the subgroup name.
Match.start([ <i>group</i> ])	Return the indices of the start of the substring matched by <i>group</i>
Match.end([ <i>group</i> ])	Return the indices of the end of the substring matched by <i>group</i>
Match.span([ <i>group</i> ])	For a match <i>m</i> , return the 2-tuple (m.start([ <i>group</i> ]), m.end([ <i>group</i> ]))
Match.pos	The value of <i>pos</i> which was passed to the <b>search()</b> or <b>match()</b> method of the <b>regex object</b>
Match.endpos	Likewise but the value of <i>endpos</i>

### Match objects (cont)

Match.lastindex	The integer index of the last matched capturing group, or <b>None</b> .
Match.lastgroup	The name of the last matched capturing group or <b>None</b>
Match.re	The <b>regular expression object</b> whose <b>match()</b> or <b>search()</b> method produced this match instance
Match.string	The string passed to <b>match()</b> or <b>search()</b>

### Special escape characters

<b>^</b>	Match only at the start of the string
<b>\b</b>	Match the empty string at the beginning or end of a word
<b>\B</b>	Match the empty string when <i>not</i> at the beginning or end of a word
<b>\d</b>	Match any <b>Unicode</b> decimal digit this includes [0-9]
<b>\D</b>	Match any character which is <b>not</b> a decimal digit
<b>\s</b>	Match <b>Unicode</b> white space characters which includes [ \t\n\r\f\v]
<b>\S</b>	Matches any character which is <b>not</b> a whitespace character. The opposite of <b>\s</b>
<b>\w</b>	Match <b>Unicode</b> word characters including [a-zA-Z0-9_]
<b>\W</b>	Match the opposite of <b>\w</b>
<b>\Z</b>	Match only at the end of a string

### Regular Expression Objects

<code>Pattern.search(string[, pos[, endpos]])</code>	See <code>re.search()</code> . <code>pos</code> gives an index where to start the search. <code>endpos</code> limits how far the string will be searched.
<code>Pattern.match(string[, pos[, endpos]])</code>	Likewise but see <code>re.match()</code>
<code>Pattern.fullmatch(string[, pos[, endpos]])</code>	Likewise but see <code>re.fullmatch()</code>
<code>Pattern.split(string, maxsplit=0)</code>	Identical to <code>re.split()</code>
<code>Pattern.findall(string[, pos[, endpos]])</code>	Similar to <code>re.findall()</code> but with additional parameters <code>pos</code> and <code>endpos</code>
<code>Pattern.finditer(string[, pos[, endpos]])</code>	Similar to <code>re.finditer()</code> but with additional parameters <code>pos</code> and <code>endpos</code>
<code>Pattern.sub(repl, string, count=0)</code>	Identical to <code>re.sub()</code>
<code>Pattern.subn(repl, string, count=0)</code>	Identical to <code>re.subn()</code>
<code>Pattern.flags</code>	The regex matching flags.

### Regular Expression Objects (cont)

<code>Pattern.groups</code>	The number of capturing groups in the pattern
<code>Pattern.groupindex</code>	A dictionary mapping any symbolic group names to group members
<code>Pattern.pattern</code>	The pattern string from which the pattern object was compiled

These objects are returned by the `re.compile()` method

### Flags

ASCII, A	ASCII-only matching in <code>\w</code> , <code>\b</code> , <code>\s</code> and <code>\d</code>
IGNORECASE, I	ignore case
LOCALE, L	do a local-aware match
MULTILINE, M	multiline matching, affecting <code>^</code> and <code>\$</code>
DOTALL, S	dot matches all
u	unicode matching (just in <code>(?aiLmsux)</code> )
VERBOSE, X	verbose

Flags are used in `(?aiLmsux-imsx:...)` or `(?aiLmsux)` or can be accessed with `re.FLAG`. In the first form flags are set or removed.

This is useful if you wish to include the flags as part of the regular expression, instead of passing a flag argument to the `re.compile()` function
